

WINTER CLOSING KIT

For Pools Up to 45,000 Gallons

This Kit Contains:

- 3 lbs Crystal Chlor Granular Chlorinator
- 3 lbs Winterizing Powder Algaecide
- 3 lbs Winter Alkalizer pH Stabilizer
- 1 Quart Metal Control
- 1 Disposable Floating Chlorinator filled with 4 lbs of Chlorine Tablets

Premium Kit

Directions

1st: Remove all the packages from the kit and fill a plastic pail with pool water. Add the winterizing algaecide and stir until all the particles are dissolved. Pour the diluted solution into the pool while walking around the perimeter. Let the filter run for at least 1 hour to distribute.

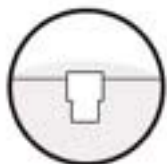

2nd: With the pump running, add the pH stabilizer while walking around the pool. Add this directly to the pool water.

3rd: With the pump still running, add the crystal chlor (shock treatment) through the skimmer. Take at least 1 or 2 minutes to sprinkle in the whole amount and make sure there are no other chemicals present in the skimmer beforehand. Adding through the skimmer will prevent possible bleaching of vinyl liners. (Note: If it is necessary to add winter chlor directly to your pool water, pre-dissolve powder in a bucket of pool water before adding.

4th: Pour Metal Control while walking around the entire perimeter of your pool. Let filter run for 1 hour to distribute.

5th: Cut off up to three feeder nubs on each side of the Floater. Tie off Chlorine Floater in the middle of the pool as shown. Failure to do so will cause bleaching of your liner.

Please Note: Each of these products is a winterizing product by itself and if used alone, directions and dosages should be followed. However, by using two or more of these products together the winterizing efficiency is greatly improved and dosages need not necessarily reflect the size of the pool.
